

## WHAT WE DO

Research and development of the most advanced organic and non-toxic fertilizers, pesticides, and soil improvements in the world providing the best on-going service and technologies to individuals, agriculture, distributors, communities, countries and all other green growing areas.

This letter is to give you a general understanding of Green World Path's products, services and efforts of putting forth our green technologies and services. It specifically is meant to draw your attention to our efforts we make early on in the first stages of a new alliance with an area, state or country distributor.

Often, we will be directly involved with a country's top leadership - in most cases, the agricultural and/or environmental departments, along with agricultural companies and organizations, communities and groups of farmers - even one farmer. We also provide the same information and assistance on an on-going basis to operators of greenhouses, nurseries, golf courses, turf growers and any other green growing arena. With all of this said, we are definitely in all green growing arenas including municipalities and armed forces.

With that lengthy overview of our involvements, most of our efforts are involved with introducing organic and non-toxic products for savings and sustainability.

The company sales have been growing every year and now are starting to double. In 2012, we expect our sales to be in the millions and continue to double annually. We are a world leader in organic and non-toxic products and technologies. Our products greatly reduce and/or eliminate the use of expensive and toxic commercial chemical fertilizers, pesticides and fungicides. We eliminate soil, groundwater, and downstream contamination. We concurrently and significantly reduce overall expenditure on growing inputs.

There is a great deal more to us than just "environmentally friendly." We are community, state and country builders - improving infrastructure, commerce, employment, families' lives and local and governmental economies.

This all starts with stopping the indiscriminate use of chemicals, introducing products and technologies that replace hardcore, sometimes skull and cross bone type products that are very damaging to soil, plant, animal and human health. These are replaced with non-toxic, sustainable materials which build soil and plant health, rather than reducing it.

Since the middle of the 20th century, synthetic chemicals have been introduced, promoted, and used in most all green growing arenas. These chemicals have negatively affected much of the most valuable and high quality soils in the world, to the point where these lands are no longer productive. These negative effects have caught the attention of farmers and leaders around the world. The world is quickly turning to organic, natural and non-toxic products and methods as means to grow healthy crops.

Green World Path teaches and shows the way to eliminate using these environmental toxins, methods and products for balancing and remineralizing soil, and growing both human food and

healthy livestock - feed and food packed with minerals and nutrients - food crops that will be healthy for people and animals - all grown in a healthy soil.

GWP products for growing, soil and foliage applied, produce higher yields normally at lower costs. Soil-borne and flying insects, pests and pathogens - and the disease and mycotoxins they cause, are now controlled by healthier soil and high-energy plants that actually reject attacks and infestations.

To achieve these results, Green World Path produces a complete line of organic and non-toxic soil and plant protectants - fertilizers, major and micronutrients, and amendments - that increase the soil microflora and organic matter.

Early on in our involvement in a process GWP's trained personnel asks many questions. We want to know about the land and soils, the water, the climate and environment - we want to know what crops they have grown and desire to grow. We want to know what issues the farmers have had (good or bad) with crop health, soil / water retention, erosion, plant/pest issues and a whole lot more. We go back at least three years inquiring about their crop yields, and the type of fertilizers and pesticides used. We want to know as much as if we owned the farm. We also get into issues of marketing and pricing of their crops, and profit and loss.

Our immediate attention is given to education and showing growers how to get their land and crops off hydrocarbon based, synthetic chemicals. We develop a plan of action which includes hands-on training.

Community building may involve farmers selling their crops together in groups to bargain for higher prices. Also, value adding to their crop harvest - setting up processing, value adding and packaging a final product that can be sold to retail food stores. This may encompass setting up avenues of commerce, adding value to a community and sustainability - not only feeding themselves locally, but it also builds local commerce and revenue.

This timeline can be immediately starting with the use of Green World Path's products and technologies. In some cases, the farms will decide to withdraw from the synthetic chemicals they had previously used over a two or three year period - going organic and non-toxic. We find in the case of turf growers and golf courses, again, they can immediately switch to 100% organic methods and non-toxic products or change over in a 1-3 year period. The same applies to most all other green growing arenas.

Respectfully,

Ray Nielsen  
President, Green World Path, Inc.
